

THE OVERSPRAY REMOVALIST

Front-end, back-end, search and conversion review of oversprayremovalists.com.au, with the commercial cost of each finding.

Paint overspray across a customer vehicle, from the site's own gallery.

BOTH FORMS

The quote form's CAPTCHA returns HTTP 500 and the contact form's reCAPTCHA errors. No written enquiry can be sent.

ZERO

H1 tags, meta descriptions and analytics across all ten pages. The site is unmeasured and close to unfindable.

TWO SITES

Byte-identical content on a second domain from the same server, with no redirect between them.

SITE

oversprayremovalists.com.au

AUDITED

2 August 2026

PAGES REVIEWED

10 pages, 55 assets

THE ONE-LINE VERSION

The business has genuine authority. Thirty years, a specialist process no competitor offers, real before and after proof, and strong work in construction and insurance claims.

The website converts almost none of it. Both of its forms are broken, nothing on the site is measured, and the site is close to invisible to search.

This is not a design problem. It is a lead-capture problem.

SEVERITY 1

Actively losing money right now.

S1

1.1 THE QUOTE FORM CANNOT BE SUBMITTED

`quote.php` is the destination of the site's most prominent call to action, the red **GET A QUOTE NOW** button in the header of every page. It carries a mandatory *Enter code* field fed by an image at `verimages/image-verify.php`.

That endpoint returns **HTTP 500** with a zero-byte body, verified repeatedly with full browser headers. The image never renders, so there is no code for a visitor to read, and the field is marked mandatory.

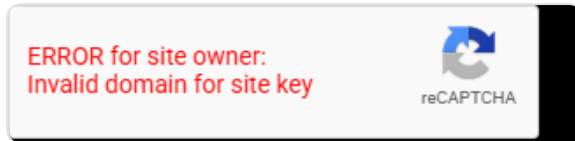

Every person who clicks the site's main call to action lands on a form they cannot complete.

```
GET /verimages/image-verify.php
attempt 1: 500 (0 bytes)
attempt 2: 500 (0 bytes)
attempt 3: 500 (0 bytes)
```

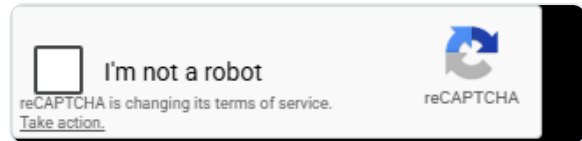

S1

1.2 THE CONTACT FORM'S RECAPTCHA IS REGISTERED TO THE WRONG DOMAIN

`contact.php` is the only other way to make contact in writing, and it is not promoted anywhere on the site (see 4.5). Its Google reCAPTCHA renders an error where the checkbox should be, so there is nothing to tick and the response field stays empty.

oversprayremovalists.com.au, the advertised domain

overspray.com.au, the duplicate

The cause connects straight to finding 1.4. The *same* site key renders a working checkbox on `overspray.com.au`. The key was registered against the duplicate domain, not the one the business advertises. The contact form works on the domain nobody is sent to, and fails on the one on the business cards.

Whether the handler rejects the submission depends on server-side code that cannot be read over HTTP, and no form was submitted during this audit. Both possibilities are bad: if it verifies the token, submissions fail; if it does not, the form has no spam protection at all. Either way the visitor sees a red error immediately above the submit button.

Between this and 1.1, there is no working written path to this business. The main call to action leads to a dead CAPTCHA image, the fallback leads to a dead CAPTCHA widget. The only route left is the phone.

reCAPTCHA site key 6Lfd2HQiAAAAABGYcONkg6LXPai0AE9Xnb91W98R

overspray.com.au	renders	I'm not a robot
oversprayremovalists.com.au	renders	ERROR for site owner: Invalid domain for site key

S1

1.3 NOTHING IS MEASURED, AT ALL

No Google Analytics, no Tag Manager, no Meta Pixel, no call tracking, no conversion events. Checked across all ten pages: zero tracking of any kind.

- Nobody knows how many people visit, what they look at, or where they leave
- Nobody knows the quote form is broken, or for how long it has been
- Paid advertising cannot run profitably: there is no conversion signal to optimise against
- There is no baseline, so no rebuild can be proven to have worked

S1

1.4 TWO IDENTICAL WEBSITES COMPETING WITH EACH OTHER

`overspray.com.au` serves **byte-identical content** to `oversprayremovalists.com.au`. Same MD5 hash, same server IP. Neither redirects to the other, neither carries a canonical tag. Google is shown two copies of the same site and asked to choose.

The result is split ranking authority and diluted backlink value. Compounding it, the email address used across the site is `info@overspray.com.au`, the *other* domain, so the contact identity and the web presence point at different places.

```
oversprayremovalists.com.au -> 192.185.161.245
overspray.com.au           -> 192.185.161.245

MD5 (both homepages)      = 312949609208db9523354fd7d64fa0a8
```

SEVERITY 2

Structurally blocking growth.

S2

2.1 THE SITE IS EFFECTIVELY INVISIBLE TO SEARCH

For a local and national service business, the on-page SEO is not weak. It is absent.

CHECK

ALL 10 PAGES

Unique <title>	No. Every page reads <i>The Overspray Removalist</i>
Meta description	None
<h1> heading	Zero H1 tags on the entire site
Canonical tag	None
Open Graph / social cards	None
robots.txt	404
sitemap.xml	404
Schema.org markup	None

Ten pages sharing one title tag leaves Google no way to tell the cement splatter page from the graffiti page from the pricing page. Sharing a link on Facebook or LinkedIn produces a bare grey box with no image, title or description.

S2

2.2 THE CONTENT IS TOO THIN TO RANK

1,836 words across the entire site, an average of 183 per page.

index	408	
pricing	352	
overspray-removal	273	
cement-splatter-removals	240	
graffiti-removals	197	
environmental-damage	188	
about	99	
gallery	57	
quote	14	
contact	8	

Service pages at 200 to 270 words will not compete for *overspray removal Melbourne* or any suburb-qualified variant. The contact page has eight words on it.

The copy that does exist is good, written by someone who plainly knows the trade. There just is not enough of it, and none of it is structured for search.

S2

2.3 NO CONTENT MANAGEMENT

Every page is hand-coded PHP. There is no CMS, no admin login, and no way for the business to change a price, add a gallery photo or update an opening hour without paying a developer to edit raw HTML.

That is why the footer still reads **Copyright © 2021**. The site reads as abandoned to anyone who scrolls to the bottom.

SEVERITY 3

Technical debt and risk.

S3

3.1 END-OF-LIFE FRONT-END STACK

LIBRARY	VERSION	STATUS
---------	---------	--------

Bootstrap	3.3.7	End of life since 2019
-----------	-------	------------------------

jQuery	1.12.4	Released 2016. Known XSS vulnerabilities (CVE-2020-11022, CVE-2020-11023)
--------	--------	---

Font Awesome	4.5.0	Superseded, served from a deprecated CDN
--------------	-------	--

All three load from third-party CDNs with **no Subresource Integrity hashes**. If any of those CDNs is compromised, arbitrary JavaScript executes on the site with nothing standing in the way.

S3

3.2 ZERO SECURITY HEADERS

Every standard protective header is absent.

Strict-Transport-Security	MISSING
Content-Security-Policy	MISSING
X-Frame-Options	MISSING
X-Content-Type-Options	MISSING
Referrer-Policy	MISSING
Permissions-Policy	MISSING

S3

3.3 PERFORMANCE

- **TTFB 684 ms.** The server sits in the United States serving an Australian market
- **4.7 MB page weight**, 4.1 MB of it images
- **No WebP or AVIF.** 35 JPG and 8 PNG, no modern formats
- **No srcset, no lazy loading.** Mobile visitors download full desktop images
- **No cache headers** on static assets, so everything re-downloads on every visit

Gzip on CSS is the one performance measure in place.

S3

3.4 THE TEMPLATE WAS NEVER FINISHED

The site is a repurposed *handyman* template. The CSS still references images from that original theme which were never replaced and do not exist, producing **12 failed image requests on every page load**.

images/serv1.png	...	serv8.png	404
images/handyman-1.png			404
images/left-lady.png			404
images/right-man.png			404
images/home-services/bottom-img.png			404

- **Zero H1 elements.** Screen reader users get no page structure
- **48 of 79 images** have missing or empty alt text
- **0 of 15 form labels** are bound to their inputs
- No skip-to-content link and no visible focus management

Beyond being a barrier to users with disabilities, this carries legal exposure under the Disability Discrimination Act for a business serving corporate and government clients.

SEVERITY 4

Conversion and trust.

4.1 DEAD LINKS AND WRONG INFORMATION

- **Social icons go nowhere.** Facebook and YouTube icons sit in the header and footer of every page, linking to "" and #x
- **The map shows the wrong place.** The embed is centred on all of Australia at continent zoom, not the Epping VIC address, and still carries the Nepal locale parameter left in by whoever built it
- **Copyright 2021** in the footer of every page

4.2 THE QUOTE FORM DOES NOT ASK FOR WHAT THE BUSINESS SAYS IT NEEDS

The pricing page states plainly:

Emailing images to us will give us a much better understanding of a problem and knowing the type of fallout it is.

The quote form has **no image upload field**. The business has told visitors exactly what it needs to quote accurately, then built a form that cannot accept it.

4.3 NO SOCIAL PROOF ANYWHERE

No testimonials. No reviews. No client or insurer logos. No case studies. No accreditations. For a high-trust, often high-value purchase where the buyer hands over a damaged vehicle or an insurance claim, there is nothing on the site that answers *why should I believe you*.

The before and after gallery is the exception. It is strong, credible proof, and it is stuck behind a lightbox on a single page with 57 words of context and no captions explaining what happened, what was done, or how long it took.

4.4 THE MOST VALUABLE OFFERS ARE BURIED

Three genuinely strong business-to-business propositions are hidden in the body copy.

1. **Volume and fleet work.** *"If there are a high volume amount of cars effected in one place... we can give a price on a volume lot"*
2. **Insurance claims management.** *"We can offer a service which includes authorisation and release forms and handle the public relations on your behalf"*
3. **Construction sector specialisation.** *"Our biggest clients are construction companies when they are pouring their slabs"*

Each is a higher-value, lower-competition buyer than a single retail car owner. None has a landing page. None is in the navigation. All three sit mid-paragraph on pages nobody lands on.

4.5 THE CONTACT FORM ADDS FRICTION AND IS NOT PROMOTED

Setting aside the broken reCAPTCHA in 1.2, the form itself works against the enquiry.

- **Six fields for a first contact**, including First Name and Last Name as separate inputs and an **Address** field. Nobody types their street address to ask a question.
- **No image upload**, the same omission as the quote form, and the same contradiction with the pricing page that explicitly asks for photos.
- **A RESET button beside SUBMIT.** One misclick wipes everything the visitor typed. Mainstream web design abandoned this roughly two decades ago.
- **No context.** No response time, no indication of what happens next, and the only instruction is "Please fill up the form".
- **Labels are not bound to inputs**, so tapping a label on a phone does not focus the field.

It is also **not a call to action anywhere on the site**. Every prominent button, including the red header CTA on all ten pages, points at the quote form. The contact form is reachable only by noticing *Contact Us* at the end of the navigation. So the weaker of the two forms is the harder one to find, and the stronger one is the one that is most visibly broken.

4.6 FRAGMENTED CONTACT IDENTITY

Two mobile numbers presented with equal weight and no routing logic, and an email on a different domain to the website. No form-fill confirmation, no auto-responder, and no after-hours path, for a service where a construction incident or a fresh insurance claim is inherently urgent.

ALL FINDINGS

Eighteen findings, ordered by what they cost.

	FINDING	SEVERITY	EFFORT
S1	Quote form CAPTCHA returns 500, primary call to action is broken	Critical	Hours
S1	Contact form reCAPTCHA errors 'Invalid domain for site key', the fallback path is broken too	Critical	Hours
S1	No analytics or conversion tracking of any kind	Critical	Hours
S1	Duplicate site on a second domain, no redirect or canonical	Critical	Hours
S2	Zero H1s, duplicate titles, no meta descriptions sitewide	High	Days
S2	No robots.txt, sitemap or schema markup	High	Hours
S2	1,836 words total, content too thin to rank	High	Weeks
S2	No CMS, the business cannot edit its own site	High	Rebuild
S4	No social proof, no reviews, testimonials or client logos	High	Days
S4	No image upload on the quote form despite the pricing page asking for photos	High	Hours
S4	Three business-to-business offers with no landing pages	High	Weeks
S3	jQuery 1.12.4 with known XSS CVEs, no SRI	Medium	Days
S3	Zero security headers	Medium	Hours
S3	4.7 MB page weight, no modern image formats, 684 ms TTFB	Medium	Days
S3	12 broken image requests per page from an unfinished template	Medium	Hours
S3	Accessibility failures: alt text, labels, headings	Medium	Days
S4	Contact form friction: six fields, split name, address, RESET button, no upload, not a call to action	Medium	Hours
S4	Dead social links, map pointing at the wrong location	Low	Hours

WHAT THIS MEANS COMMERCIALLY

The findings above, ordered by what they cost the business.

■ They cannot capture the demand they already have.

Whatever traffic arrives today hits a broken quote form, and the contact form behind it is broken too. Every written enquiry route on the advertised domain is closed, so anyone who will not pick up the phone leaves. Fixing the two CAPTCHAs is the highest-return hour of work available on this property, and it can happen before anything else is decided.

■ They cannot see anything.

With no analytics there is no way to know the size of the problem above, no way to prove a rebuild worked, and no way to run paid acquisition without burning budget blind. Tracking needs to go in before the rebuild, not after, so there is a genuine before and after.

■ They cannot be found.

No H1s, one title tag across ten pages, no sitemap, no schema, under 2,000 words, and a duplicate domain splitting whatever authority exists. For a business whose buyers search *overspray removal Melbourne* or *cement splatter car repair*, this is close to being absent from the market.

■ They cannot sell their best work.

The volume and fleet, insurance claims and construction propositions are the highest-value things this business does, and they are invisible. A single construction-industry landing page aimed at site managers, with the gallery as proof and claims management as the differentiator, would likely outperform the entire current site.

■ They look dormant.

A 2021 copyright, dead social icons, a map of the wrong continent and a broken form are the signals a procurement officer or insurance assessor reads before deciding whether to call. The work is thirty years deep. The website makes it look abandoned.

RECOMMENDED SEQUENCING

IMMEDIATE, BEFORE ANY REBUILD DECISION

Fix or remove the broken CAPTCHA so the quote form works. Add the advertised domain to the reCAPTCHA key's allowed list so the contact form works, or drop the widget for a honeypot. Both take minutes. Install GA4 and conversion tracking to establish a baseline. Redirect overspray.com.au to the primary domain. Point the map at Epping. Update the copyright. These are same-week fixes on the existing site.

PHASE 1 · FOUNDATION

Modern rebuild on a stack the business can edit itself. Unique titles, meta descriptions and H1s. Schema markup, sitemap, robots.txt. Image optimisation and modern formats. Australian hosting. Security headers. Accessibility remediation.

PHASE 2 · CONVERSION

Rebuild the quote flow with image upload, since that is what the business says it needs to quote. Restructure the gallery into captioned case studies. Add reviews and social proof. Clear routing for the two phone numbers.

PHASE 3 · GROWTH

Dedicated landing pages for construction and fleet, insurance claims management, and priority service areas. Content depth on each service. Then, with tracking finally in place, paid acquisition becomes viable.

Method: full crawl of all 10 pages and 55 assets, HTTP header inspection, endpoint probing and source review. Passive testing only. No forms were submitted and no intrusive testing was performed. Findings verified 2 August 2026.
